

LIMINGXI weekly_report in 2024/08/19--2024/08/23

planned

1. write and test nrf24l01 message sending and receiving on stm32f10x chip
2. write and test the code for the receiving and testing side of the 2.4G communication scheme based on the nrf24l01 implementation
3. write and test a remote control script that runs synchronously in a terminal running carla
4. explore the possibility of providing a peripheral view

Plan completion progress (working)

Advancing multiple tasks in parallel

1. write and test nrf24l01 message sending and receiving on stm32f10x chip
 1. currently debugging the message receiving code on the stm32 chip
2. write and test the code for receiving and testing side of the 2.4G communication scheme realized based on nrf24l01
 1. adjust the control logic of the cart
 2. adjust the sending logic of the sender
 3. design and test the code for the message forwarding microcontroller

finished

1. Provide peripheral view for carla car in follow mode.
2. Transponder microcontroller combined with nrf24l01 chip to send and receive 2.4G signals.

Unexpected events

1. Purchased nrf24l01 chip there is a bad chip
2. Accidental short caused by the microcontroller damage
3. Shooting video takes up space and time

Next work plan

Next week to complete the above single-module testing, and realize the combination of testing and simultaneous acceptance of the effect of real vehicles.
